The products featured in this catalogue are also presented in the VEM interactive electronic catalogue.

Further information about the company and the VEM product range can be found on the Internet at www.vem-group.com.

This online information assists you in your selection and configuration of a drive solution and incorporates functions to print out data sheets and product enquiries. In addition, scale and dimensioned product drawings can be displayed or exported in various 2D and 3D formats.

Alongside general information about the VEM group, direct access is provided to catalogues, spare parts lists, operating manuals and maintenance instructions for the individual product groups.

Note:

We are at all times committed to constant further improvement of our products. Design details, technical data and illustrations are thus subject to change and may only be deemed binding after written confirmation by the manufacturer.

Introduction
Technical explanations

Introduction

VEM is an innovative, dependable and internationally recognised manufacturer of technically sophisticated system and drive solutions, as well as special drives and individual components. The product range covers practically the complete spectrum of electric motors and drives for industrial use. Through many years of experience in three-phase drive design, manufacturing, assembly and project development, VEM has gathered a wealth of know-how in

many special fields of application. One of these fields is the steel and rolling mill industry, with its extremely challenging demands and operating conditions. VEM has developed a full, complex package of drive solutions tailored to the specific requirements of this sector. This package includes not only "classic" roller table motors, but also geared table motors in numerous versions and "special motors" for particular applications in the rolling mill industry.

Series	Light-duty VEM roller table motors				Heavy-duty VEM roller table motors			
	(Ex-)A..R	(Ex-)A..F	(Ex-)A..O	(Ex-)A..B	ARB	ARC	DS..

Housing type	Ribbed (horizontal/vertical)		Smooth surface		Ring-ribbed		Smooth/ribbed	
Thermal class	Thermal class 155, optionally 155 (F(B)), 180							
Transponder	Optional RFID system iID@2000 (13.56 MHz based on ISO 15693), (size A42. 400 as standard)							

Light-duty roller table motors, series AE.R, AE.O, AE.F for mains and converter-fed operation

Output range	0.09 – approx. 710 kW
Type of protection	IP 55 to DIN EN 60034-5, higher protection ratings as an option
Types of cooling	IC 410, IC 411, IC 416 and water-jacket cooling to DIN EN 60034-6
Construction types	IM B3, IM B35, IM B5 and derived types to DIN EN 60034-7

The series AE1R (IC 411), AE1O (IC410) and AE1F (IC 416) are derived from the VEM standard motor series and are mechanically identical in their principle design elements. The motor windings have been adapted to the particular

application of roller table drive. All screwed connections are additionally secured and the corrosion protection is similarly adapted for use in rolling mills.

Heavy-duty roller table motors, series ARC for converter-fed operation

Sizes	112 – 400
Output range	0.4 – approx. 240 kW
Type of protection	IP 55 to DIN EN 60034-5, higher protection ratings as an option
Types of cooling	IC 410, IC 411, IC 416 and water-jacket cooling to DIN EN 60034-6
Construction types	IM B3, IM B35, IM B5 and derived types to DIN EN 60034-7

The series ARC (IC 410) is designed for converter-fed operation in rolling mill applications. It represents a combination of the positive features of a converter-fed double squirrel-cage rotor, with its torque characteristic geared to optimum acceleration (MK/MB approx. 3), and the mechanically

robust construction of a heavy-duty roller table motor. The overall design is identical to that of a VEM standard motor, with the exception of the housing form (circumferential ribs) and the bearing/seal arrangement on the D end.

Heavy-duty roller table motors, series ARB for mains operation

Sizes	22 (132), 33 (125), 54 (180), 65 (200)
Output range	0.4 – 5.5 kW
Type of protection	IP 55 to DIN EN 60034-5, higher protection ratings as an option
Type of cooling	IC 410 to DIN EN 60034-6
Construction types	IM B3, IM B35, IM B5 and derived types to DIN EN 60034-7

The heavy-duty roller table motor ARB (IC 410) is designed for mains operation. As with the ARC series, the housing is provided with circumferential cooling ribs. It is manufac-

ured from grey-cast iron with ribs running transverse to the shaft direction. The conventional motor design achieves a soft torque characteristic and long blocking times.

Transnorm motors, series DS, DSf, DSo, DSWM for mains and converter-fed operation

Sizes	355 – 630
Output range	100 – approx. 1400 kW
Type of protection	IP 55 to DIN EN 60034-5, higher protection ratings as an option
Types of cooling	IC 410, IC 411, IC 416 and water-jacket cooling to DIN EN 60034-6
Construction types	IM B3, IM B35, IM B5 and derived types to DIN EN 60034-7

Robust to meet the toughest demands

The motors are designed as welded steel constructions and can be adapted to specific project demands. The drive elements of the mill and driving tables in rolling mills are subjected to particularly exacting electrical and mechanical demands. They must cope with a diversity of operating modes, such as continuous, intermittent and short-time duty, as well as start-up, braking and reversing functions. Furthermore, the motors must withstand the high ambient temperatures arising from the molten steel and the overloads which may occur if jammed stock blocks the transport system. Exposure to water must frequently be expected, and this must be taken into account by the mechanical design of the motor. VEM roller table motors are ideally prepared to handle all such extreme operating conditions.

Fig. 1: Wide hot strip mill train, ARC 315

Proven quality – modern design

VEM roller table motors of the classic series ARB 22 – 65 have been demonstrating their function capabilities and reliability under often extreme ambient conditions for many decades.

On the basis of this experience, VEM has developed several variants of roller table motors, which are each adapted to the special requirements of modern drive technologies for use in conjunction with a frequency converter. The motor windings are designed specifically for converter-fed operation. In contrast to a classic roller table motor design with soft torque characteristic and long blocking times, roller table motors for converter-fed operation feature a specially tailored characteristic, as is typical for a double squirrel-cage rotor. This ensures reliable synchronous operation with grouped drives, even under changing loads, which in turn is a prerequisite for high rolling quality.

Fig. 2: Motor of the ARB series for mains operation

Fig. 3: Motor of the ARC series with built-on holding brake and incremental encoder

Versatile applications – individual adaptation

With regard to their mechanical design, the motors are available either as robust grey-cast constructions with horizontal/vertical ribbing, in versions with self- or forced ventilation as series IE2-AE.R/AE.F or in a non-ventilated version as series IE2-AE10, or else on the basis of a ring-ribbed housing in the case of series ARC and ARB.

In converter-fed operation, the operating speeds can be matched perfectly to the individual drive requirements. As control is realised primarily in the lower frequency range, project-specific adaptation of the windings and the use of a frequency converter with automatic voltage boost or field-oriented control are recommended. The windings are designed specifically for converter-fed operation. Detailed operating data sheets are available to assist project planning. They are based on windings for thermal class 155. Designs for thermal class 180 are also possible as an option, for example as a means to increase the frequency of switching operations.

For existing installations, it is still possible to choose the heavy-duty series ARB, which is designed specifically for mains operation and can withstand a blocking period of several minutes without damage (soft torque characteristic, additional heat sinks on the rotor).

Fig. 4: Furnace table with ARG 200L 12, $M_{\max}=1888$ Nm

Geared roller table motor version

The single- and multi-stage gearing arrangements used by VEM motors GmbH are developed in cooperation with leading gear manufacturers and designed specifically for operation in continuous casting, furnace and rolling mill plant.

All individual components meet the tough demands posed by such environments. The gear housings are manufactured as grey cast iron (GG), spheroidal cast iron (GGG) or welded steel constructions, depending on the motor type and version. The dimensioning of the wall thickness ensures that ample space is available for the bearings and seals required at a particular place of installation. The actual gears are likewise matched in their dimensions to the individual demands. The gear teeth are designed as corrected involute helical teeth and have been case-hardened and honed. The quality complies with the stipulations of DIN quality class 7. The material used is 16MnCr5, 20MnCr5 or 17CrNiMo6. The drive shaft is sealed to the outside with a VITON sealing ring running on a hardened and ground bushing and with an additional labyrinth seal in order to prevent the penetration of dust, scale or water. The gearing is oil-lubricated (immersion lubrication). For special applications, for example in continuous casting plant (high ambient temperatures), we recommend lubrication with synthetic oils. In certain cases, fluid grease may be sufficient.

The torques specified in the data sheet are firstly the nominal torque and secondly the acceleration or breakdown torque. The breakdown torque generally lies 20 – 30% above the acceleration torque. The nominal torque can be delivered 24 hours a day without influencing service life. The acceleration torque can occur for a duration of 5 seconds approx. 100 times per hour without influencing the service life of the gearing. The maximum loading of the gears is designed such that the acceleration torque can be exceeded by 2.5 times occasionally (also several times per day, but not more than 10 times per hour for 2 seconds in each case), without influencing the service life of the gearing. The gearing is durable at acceleration torque. The motors are integrated with the gearing by way of at least four bolts. They can thus be separated from the gearing

Fig. 5: Roller table version, SG200 ARG 200L 8, $M_{\max} = 1655$ Nm

Fig. 6: Delay table with S141-1A ARG 160L 4, $M_{\max}=1039$ Nm

at any time, for example for maintenance purposes. It is merely necessary to drain the oil from the gearing before separation. The motors always possess an oil-tight seal at the drive end. The bearing on the non-drive end is generally provided with lifetime lubrication.

VEM – your competent partner for drive questions

Wherever our customers need electric machines, we are at hand as a partner and offer every necessary support at all phases of a project. It is not important whether you are doing business in Europe, the Middle East, Asia or America. As the VEM market share increases also outside Germany, we are also expanding our sales network with a combina-

tion of own subsidiary companies and strategic alliances. Already today, our customers can address their questions to competent and experienced local partners all over the world. The dense network of sales and service contacts comprises agents and representatives in more than 40 countries.

Standards and regulations

The motors comply with all relevant standards and regulations, in particular with the following:

Title	International IEC	Europe EN
Rotating electrical machines. Rating and performance	IEC 60034-1	EN 60034-1
Methods for determining losses and efficiency of rotating electrical machinery from tests	IEC 60034-2-1	EN 60034-2-1
Efficiency classes of single-speed, three-phase, cage-induction motors	IEC 60034-30	EN 60034-30
Degrees of protection provided by the integral design of rotating electrical machines (IP code) – Classification	IEC 60034-5	EN 60034-5
Methods of cooling (IC code)	IEC 60034-6	EN 60034-6
Classification of types of construction, mounting arrangements and terminal box position (IM code)	IEC 60034-7	EN 60034-7
Terminal markings and direction of rotation	IEC 60034-8	EN 60034-8
Noise limits	IEC 60034-9	EN 60034-9
Starting performance of single-speed three-phase cage induction motors	IEC 60034-12	EN 60034-12
Mechanical vibration of certain machines with shaft heights 56 mm and higher – Measurement, evaluation and limits of vibration severity	IEC 60034-14	EN 60034-14
Balance quality requirements	ISO 1940	–
IEC standard voltages	IEC 60038	–
Electrical insulation – Thermal evaluation and designation	IEC 60085	–
General purpose three-phase induction motors	IEC 60072-1	EN 50347

VEM motors comply furthermore with various foreign regulations which are either based on IEC 60034-1 or else transpose the latter's stipulations as European standard EN 60034-1.

The following temperature-rise limits apply in conjunction with the aforementioned standards and regulations:

Regulation	Cooling air temperature	Permissible temperature-rise limit in K (measured by resistance method)				
		105 [A]	120 [E]	130 [B]	155 [F]	14,80 [H]
Thermal class acc. to EN 62114	°C					
EN 60034-1	40	60	75	80	105	125
IEC 60034-1	40	60	75	80	105	125
Great Britain	40	60	75	80	105	125
Italy	40	60	70	80	105	125
Sweden	40	60	70	80	105	125
Norway	40	60	-	80	105	125
Belgium	40	60	75	80	105	125
France	40	60	75	80	105	125
Switzerland	40	60	75	80	105	125

Efficiency classification (IE code)

Over the past few years, the worldwide developments relating to energy-saving motors have produced a multitude of country-specific regulations, laws and standards, which makes it difficult to properly compare individual products. The new IEC/EN standard 60034-30 is thus intended to establish a global common basis. In Europe, the standard supersedes the previous "Voluntary Agreement of CEMEP". Its scope has at the same time been extended to cover an output range from 0.75 kW to 375 kW, not only for 2- and 4-pole motors, but now also to 6-pole versions. The forthcoming second edition of IEC/EN 60034-30 will broaden the scope yet again. When it comes into force, the regulations will in future apply across an output range from 0.12 kW to 1000 kW, and will additionally include 8-pole

motors in the classification. The relevant ambient conditions are likewise to be extended significantly. The stipulations will then apply for a temperature range from -30 °C to + 60 °C, and for altitudes up to 4000 metres above sea level. Following the convention used to designate types of protection (IP = International Protection), the efficiency classes are indicated by the letters IE, standing for International Efficiency:

IE1	Standard Efficiency (former class EFF2)
IE2	High Efficiency (former class EFF1)
IE3	Premium Efficiency
IE4	Super Premium Efficiency

Efficiency determination

Parallel to the introduction of the new efficiency classes, the standard describing methods for the determination of efficiency has also been amended. In accordance with IEC/EN 60034-2-1, the additional losses are no longer simply assumed to be 0.5% of the power input, but instead determined in the manner of IEEE 112. The losses determined in this way vary with the motor power and lie between 3.5% (low power) and 0.5% of the power input. Consequently, the nominal efficiency may be reduced, even

though no actual changes have been made to the motors themselves.

Previously: $P_{LL} = 0.5\%$ of input power P
Now: $P_{LL} =$ individual measurement

P_{LL} = load-dependent additional losses

The following tables shows corresponding examples:

Example (EFF1, IE2) P / motor type	Loss determination method acc. to EN/IEC 60034-2:1996, 50 Hz	Loss determination method acc. to IEC 60034-2-1:2007, 50 Hz
5.5 kW, 2-polig	89.2 %	88.7 %
55 kW, 2-polig	94.5 %	93.2 %
5.5 kW, 4-polig	89.6 %	89.9 %
55 kW, 4-polig	95.0 %	94.0 %
5.5 kW, 6-polig	87.5 %	86.1 %
55 kW, 6-polig	95.2 %	93.5 %

The new limit values have been adapted to this method. IEC/EN 60034-2-1 replaced the previously used IEC/EN 60034-2 with effect from November 2010. As a formal conversion of test results to the new measuring method is not possible, the

new stipulations are being introduced in stages. IE-classified motors are always assessed according to IEC/EN 60034-2-1. In the case of motors without classification, the efficiency specifications are in part still based on EN 60034-2.

Notes on application of IEC/EN 60034-30 and Commission Regulation (EC) No. 640/2009

With Commission Regulation (EC) No. 640/2009 of 22nd July 2009, which serves to implement European Directive 2005/32/EC, minimum efficiency classes (Minimum Efficiency Performance Requirements, MEPS) are now stipulated on the basis of EN 60034-30:2009 and are to be gradually introduced in the market for certain types of electric motor:

Which motors are covered by EN 60034-30:2009?

Single-speed three-phase asynchronous motors with squirrel-cage rotor for 50 Hz and/or 60 Hz which are designed

- with a rated voltage U_N up to 1000 V;
- with a rated output P_N between 0.75 kW and 375 kW;
- with 2, 4 or 6 poles;

- for duty types S1 (continuous duty) or S3 (intermittent periodic duty) with a cyclic duration factor of 80% or more;
- for direct starting on the mains;
- for rated operating conditions in accordance with EN 60034-1, section 6.

Which motors are excluded from IE classification by EN 60034-30:2009?

- Motors which are designed specifically for converter-fed operation in accordance with IEC 60034-25;
- Motors which are fully integrated into a machine (e.g. pumps, fans and compressors) and cannot be tested separately.

Which motors are not covered by Commission Regulation (EC) No. 640/2009?

- a) Motors which are designed to be operated wholly immersed in a liquid;
- b) Motors which are fully integrated into a product (e.g. a gearbox, pump, fan or compressor) such that the energy efficiency cannot be determined separately from the product;
- c) Motors which are designed specifically for operation under the following conditions:
 - i) Altitude more than 1000 metres above sea level;
 - ii) Ambient temperatures above 40 °C;
 - iii) Maximum operating temperatures above 400 °C;
 - iv) Ambient temperatures below -15 °C (any motor) or below 0 °C (water-cooled motor);
 - v) Coolant temperatures below 5 °C or above 25 °C at the inlet to a product;
 - vi) Potentially explosive atmospheres in the sense of Directive 94/9/EC
- d) Brake motors

Amendments in Commission Regulation (EU) No. 4/2014 of 6th January 2014

- Altitude above 1000 metres, now 4000 metres
- Ambient temperatures above 40 °C, now 60 °C
- Ambient temperatures below -15 °C, now -30 °C, or below 0 °C for water-cooled motors
- Coolant temperatures below 5 °C, now 0 °C, and above 25 °C, now 32 °C.

These changes become effective from 27th July 2014.

Which deadlines apply for the introduction of minimum efficiency

Stage 1: Minimum efficiency class IE2 since 16th June 2011

Stage 2: Tightening to IE3 [Premium Efficiency] with effect from 1st January 2015 for the output range 7.5 kW to 375 kW. Optional possibility: "IE2 + converter".

Stage 3: Extension of output range to between 0.75 kW and 375 kW with effect from 1st January 2017. The optional possibility "IE2 + converter" remains applicable.

The manufacturer guarantees to the customer by way of CE marking that the required nominal efficiency is attained and that the rated efficiency specified on the rating plate is observed.

The permissible tolerances specified in DIN EN 60034-1 continue to apply.

New requirements for documentation (excerpt from Reg. (EC) No. 640/2009)

From 16th June 2011, the information set out points 1 to 12 is to be displayed visibly:

- a) in the technical documentation of motors;
- b) in the technical documentation of products into which motors are incorporated;
- c) on freely accessible websites of the manufacturers of motors;
- d) on freely accessible websites of the manufacturers of products into which motors are incorporated.

In the technical documentation, the information must be provided in the order as presented in points 1 to 12. It is not imperative to use the exact wording used in the list. The information may also be presented using graphs, diagrams and symbols.

1. Nominal efficiency (η) at 100%, 75% and 50% of the rated load and voltage (U_N);
2. Efficiency level: "IE2" or "IE3";
3. Year of manufacture;
4. Manufacturer's name or trademark, commercial registration number and place of business;

5. Product model number;
6. Number of poles of the motor;
7. Rated power output(s) or range of rated power output [kW];
8. Rated input frequency(-ies) of the motor (Hz);
9. Rated voltage(s) or range of rated voltage [V];
10. Rated speed(s) or range of rated speed [rpm];
11. Information relevant for disassembly, recycling or disposal at the end-of-life of the product
12. Information on the range of operating conditions for which the motor is specifically designed:
 - (i) altitudes above sea level;
 - (ii) ambient air temperatures, also for motors with air cooling;
 - (iii) water coolant temperature at the inlet to the product;
 - (iv) maximum operating temperature;
 - (v) potentially explosive atmospheres.

Since 16th June 2011, it is no longer permissible to bring non-classified or IE1 standard motors onto the market in the EU.

Type designation

The type designation comprises 7 basic parts + a code for special versions, namely

- the energy efficiency class,
- the motor version,
- the series code,
- the type of cooling,
- the size/shaft height,
- the foot length and a supplementary code for output definition
- the number of poles, and
- the special version code,

which are strung together to form a complete motor designation. It is not imperative for each of the 8 elements to be present. In the following, the individual elements are explained together with their possible combinations. Deviations from the type designation are only permissible for certified series, for example CSA-certified motors are only available as K11R.

The type code is valid for newly determined ID numbers from the date of publication.

IE2	-	A	E	1	R	160	M	X	2	IL	...	HW
1		2	3		4	5	6		7	8	...	9

1. Energy efficiency class

	Designation	Standard
(none)	Not classified	-
IE2	High Efficiency	IEC/EN 60034-30
IE3	Premium Efficiency	IEC/EN 60034-30

2. Motor version

	Designation
A	Roller table motor
B	Brake motor (squirrel-cage rotor)
DS	Three-phase transnorm motor as welded steel construction

3. Series

	Designation
	Not specified in case of three-phase transnorm motors as welded steel construction
E1	Energy-saving series with efficiency class IE2, design generation 1
E2	Energy-saving series with efficiency class IE2, design generation 2 (all sizes/numbers of poles)
RB	In combination with 2 nd code element A: Roller table motor for mains operation, type of cooling IC 410, 4 th code element not applicable
RC	Ring-ribbed housing In combination with 2 nd code element A: Roller table motor for converter-fed operation, type of cooling IC 410, 4 th code element not applicable
RG	Ring-ribbed housing In combination with 2 nd code element A: Geared roller motor for converter-fed operation, type of cooling IC 410

4. Type of cooling

4.1 Standard series

	Designation	Type of cooling
B	Water cooling	IC 71W, (IC 31W)
WM	Water jacket cooling for three-phase transnorm motors as welded steel construction	
F	Rib cooling with built-on forced-ventilation fan	IC 416
f	Rib cooling with built-on forced-ventilation fan for three-phase transnorm motors as welded steel construction	
O	Rib cooling without own fan	IC 410
o	Rib cooling without own fan for three-phase transnorm motors as welded steel construction	
R	Rib cooling with own fan	IC 411

5. Size

63, 71, 80, 90, 100, 112, 132, 160, 180, 200, 225, 250, 280, 315, 355, 400, 450, 500, 560, 630
ARB: 22 (132), 33 (125), 54 (170) and 65 (200) – Figures in brackets: Shaft height in mm

6. Foot length/supplementary code for output definition

Foot length	Designation	Supplementary code	Designation
S	short	X	Higher output in case of two outputs/foot length
M	medium	Y	Reduced output ¹⁾
L	long	Z	Higher output in case of three outputs/foot length

¹⁾ increased output for size 315

7. Number of poles

2p=	Synchronous speed n (at 50 Hz) [rpm]
2	3000
4	1500
6	1000
8	750
10	600
12	500
16	375
20	300
24	250

Hyphen as separator in case of pole-switching motors, descending number of poles

Codes for special versions

TWH	Thermal winding protection with NTC thermistor
TPM	Thermal winding protection with PTC thermistor
WE	Special shaft
....

For further details, see overview of modifications

Name plate

In the normal standard version, the motor name plate displays information in the German and English languages. Other languages are possible, though an extra charge must be made for non-EU languages.

The name plate displays the most important rating data, such as the type designation and motor number, output, rated voltage and frequency, rated current, type of construction, type of protection, power factor, speed and thermal class.

The scope of information may vary according to motor type. In the case of motors with relubrication system, the relubrication interval and the grease amount per lubrication cycle are also specified either on the name plate itself or on an additional plate. Name plates are attached to the housing using grooved pins such that they are permanently secure. They can be made of aluminium or stainless steel (extra charge).

Consultation is necessary if additional plates are required.

Fig. 7: Example of a name plate for roller table motors

Fig. 8: Example of a name plate for geared roller table motors

Cooling and ventilation

Roller table motors of the heavy-duty series ARB and ARC are designed without ventilation fans for type of cooling IC 410.

Light-duty roller table motors of series AE.R are fitted with radial fans made from plastic or cast aluminium alloy, which provide cooling independently of the running direction of the motor (IC 411 to EN 60034-6). For noise reasons, 2-pole

motors with shaft height 355 can only be supplied with low-noise, direction-dependent fans. When installing the motors, a minimum clearance between the fan hood and the wall (dimension B1) must be observed to ensure correct cooling. The fan hood is always manufactured in sheet steel. This series can also be supplied without ventilation (AE.O...) or with forced ventilation (AE.F ...) as an option.

Design versions

The housings of the light-duty series AE.O possess horizontal/vertical ribbing, those of the heavy-duty series ARB, ARC cooling ribs transverse to the shaft direction. Both housing designs are characterised by their high mechanical strength and very good thermal capacity. The terminal box for motors of the series AE.O can be mounted either

at the top, on the right or on the left, as is the case for the standard motor series K21R, K20R. The terminal box for series ARB is mounted on the right, while that for series ARC is positioned either on the top at the non-drive end or optionally on the non-drive-end shield.

Shaft height	Series	Housing	Material for bearing end shields	Feet	Foot mounting
132 to 280 315	AE1R AE1O AE1F	Grey cast iron	Grey cast iron	Grey cast iron	Bolted
355, 400	AE2R, AE2O, AE2F				Cast-on
112 to 400	ARC				Cast-on
22 to 65	ARB				Cast-on
355 to 630	DS, DSf, DSo, DSWM	Steel	Steel	Steel	Welded

1

Type of protection

The motors possess condensation drain holes in their end shields (by request only for shaft heights up to 132 T). These holes are closed with plastic plugs.

In case of motors with a shaft end pointing upwards, the user must take appropriate precautions to prevent the penetration of water along the shaft.

On flange motors of construction types IM V3 / IM V36, a drain hole is provided as standard to prevent the collecting of liquid in the flange end. Where motors are

to be used or stored outdoors, a corresponding roof or additional covers are recommended in order to avoid long-term exposure to direct sunlight, rain, snow and dust, and to eliminate the risk of the fan freezing up due to direct snowfall or icing. In such cases, it is recommended to consult the manufacturer for technical clarification. The use of non-rusting bolts and screws (option) is recommended if the motor is to be used outdoors or in a corrosive environment. Any deviating ambient conditions are specified on the motor name plate. The specifications on the name plate shall then apply.

Types of construction

The most common types of construction are shown in the list below. Further types of construction can be supplied upon request. The type of construction is indicated on the name plate in accordance with Code I, EN 60034-7. Standard motors which are ordered in a basic type in sizes 56 to 200 can also be operated with the following derived types of construction.

- IM B3 in IM B5, IM B7, IM B8 and IM V6
- IM B35 in IM 2051, IM 2061, IM 2071 and IM V36
- IM B34 in IM 2151, IM 2161, IM 2171 and IM2131
- IM B5 in IM V3
- IM B14 in IM V19

Motors of types IM V5, IM V1 or IM V18 can be designed with an optional protective canopy to prevent small parts falling into the motor. With types of construction with the shaft end pointing upwards, it is the responsibility of the user to provide a suitable cover to prevent small parts falling into the fan shroud (see also standard IEC/EN 60079-0). The cooling air flow must not be hindered by the cover. From size 225, it is necessary to consult the manufacturer regarding types of construction IM V5, IM V6, IM B6, IM B7 and IM B8. The types of construction IM B5 and IM V3 are not available for frame sizes from 315 L. To facilitate connection to the mains power supply, the terminal box can be rotated by 90° with all types of construction (with the exception of motors with terminal box 630 or 1000, inclined – in these cases, the terminal box can only be rotated by 180°).

Vibration response and balancing

The permissible vibration severities for electric motors are specified in standard EN 60034-14. VEM motors already meet or remain below the limit values specified for vibration severity grade A (normal, with design-

ation on the name plate) in their basic versions. Vibration severity grade B (special code “SGB” in the type designation) can be supplied at extra charge.

EN 60034-14 recommends the following values:

Vibration severity grade	Shaft height H Machine installation	56 ≤ H ≤ 132			132 ≤ H ≤ 280			280 > H		
		s _{eff} [μm]	v _{eff} [mms ⁻¹]	a _{eff} [ms ²]	s _{eff} [μm]	v _{eff} [mms ⁻¹]	a _{eff} [ms ²]	s _{eff} [μm]	v _{eff} [mms ⁻¹]	a _{eff} [ms ²]
A	Free suspension	25	1.6	2.5	35	2.2	3.5	45	2.8	4.4
	Rigid mounting	21	1.3	2.0	29	1.8	2.8	37	2.3	3.6
B	Free suspension	11	0.7	1.1	18	1.1	1.7	29	1.8	2.8
	Rigid mounting	-	-	-	14	0.9	1.4	24	1.5	2.4

Grade A is applicable for machines with no special vibration requirements.

This grade is essentially equivalent to the old grade N in case of free suspension. For motors from size 250, the limit values are tightened from 3.5 mm/s to 2.8 mm/s. This corresponds to the former limit value for R at speeds > 1800 rpm.

Grade B is applicable for machines with special vibration requirements.

This grade is essentially equivalent to the old grade S in case of free suspension. The corner frequencies for vibration displacement/vibration velocity and vibration velocity/vibration acceleration are 10 Hz and 250 Hz, respectively. It must be noted that the measured values may deviate from the actual values by ± 10% due to the tolerances of the measuring devices.

With regard to the routine testing of machines with speeds between 600 and 3600 rpm, EN 60034-14 states that it is sufficient to measure the vibration velocity.

All rotors are balanced dynamically with a half-key in place. This balancing is documented on the name plate by way of the letter “H” after the motor number. Upon request, it is possible to perform balancing with a full key. This is subsequently indicated by the letter “F” after the motor number. In case of converter-fed operation with frequencies greater than 60 Hz, special balancing is required to observe the specified limit values (high-speed version, special code “HS” in the type designation).

Bearings

VEM motors are fitted with anti-friction bearings from leading manufacturers. The nominal service lifetime of the bearings is at least 10,000 hours for 2-pole motors or 20,000 hours for motors with 4 or more poles, assuming full exploitation of the maximum permissible load. The nominal service lifetime of the bearings for motors installed in a hori-

zontal position without additional axial load is 40,000 hours in coupled operation. Under average operating conditions, with loads below the maximum permissible load, a nominal service life L_{h10} of 10,000 hours can be achieved. Detailed specifications are to be found in the Main Catalogue.

Bearing monitoring

To permit monitoring of the condition of the bearings, motors can be fitted with or prepared for the fitting of temperature, shock pulse and vibration sensors. PT100-type temperature sensors can be mounted at the bearing points in 2-, 3- or 4-wire configurations. The sensors are connected at the main terminal box or else in a separate box mounted either on the main terminal box or on the motor housing, depending on the individual design.

For monitoring of the wear of the anti-friction bearings, shock pulse sensors [SPM] can be mounted on the end shields from size 132. This permits monitoring by way of mobile recording units. It is also possible to use hard-wired shock pulse or vibration sensors to enable remote monitoring.

Use of insulated bearings

When motors are operated on the mains, magnetic asymmetries result in a voltage along the shaft. This shaft voltage causes compensating currents to flow between the rotor and stator via the anti-friction bearings. If the voltage exceeds a threshold of 500 mV, the bearings may be damaged. The design of VEM standard motors ensures that this value can never be exceeded.

The effects may be intensified in case of converter-fed operation. The converter design is a decisive influencing factor. Pulse-controlled converters produce especially high-

frequency voltages and currents dependent on the pulse frequency and the pulse modulation. Output filters in the converter minimise these effects. To avoid bearing damage, motors for converter-fed operation from size 315 MY are always fitted with an insulated bearing on the non-drive end. In addition to this measure, it is always imperative to provide for proper earthing of the motor housing in order to drain the currents circulating between the converter and stator.

Shaft ends

IEC 60034-7 defines the two sides of a motor as follows:

D-end (DS): Drive side of the motor (drive end)
N-end (NS): Side of the motor opposite the drive (non-drive side)

Centre holes in accordance with DIN 332, sheets 1 and 2, form DS.

The keys and keyways are machined in accordance with DIN 6885 sheet 1, form A or B for frame sizes 56 – 112 and in accordance with DIN 6885 sheet 1, form A for frame sizes 132 – 355. The lengths of the keys comply with EN 50347 for shaft heights 132 – 355.

Threads for fitting and pulling fixtures

Shaft end diameter	Thread
from 7 to 10 mm	M3
from 10 to 13 mm	M4
from 13 to 16 mm	M5
from 16 to 21 mm	M6
from 21 to 24 mm	M8
from 24 to 30 mm	M10
from 30 to 38 mm	M12
from 38 to 50 mm	M16
from 50 to 85 mm	M20
from 85 to 130 mm	M24

The motors are always supplied with the shaft key inserted.

The second shaft is able to transmit the full nominal output in the case of a coupled drive. The output transmitted by the second shaft end in the case of belt, chain and pinion drives can be notified upon request. Slotted drive elements, such as belt pulleys or couplings, must be balanced with a half-key to at least balance quality grade G 6.3 according to DIN ISO 1940-1.

True running of the shaft ends

The true running of the shaft ends complies with the requirements of EN 50347. The relevant values can be reduced by 50% as an option (extra charge).

Noise ratings

Noise levels are measured at rated output, rated voltage and rated frequency in accordance with EN ISO 3741. EN 60034-9 stipulates that the noise level in dB(A) is to be specified as the spatial mean value of the sound pressure level L_{pA} measured at a distance of 1 metre from the machine contour.

The A-weighted sound power level L_{WA} over the measuring surface L_s ($d = 1$ m) is calculated with

$$L_{WA} = L_{pA} + L_s \quad (\text{dB})$$

The measuring surface level is dependent on the machine geometry and is for

Frame size		L_s (dB)
56 – 132		12
160 – 225		13
250 – 315		14
355		15

The noise values for the main series are presented in tabular form. For machines in 60 Hz versions, a value 4 dB(A) higher than the table value can be taken as a guideline. Binding specifications for 60 Hz upon request. Consultation is necessary with regard to special series.

Winding and insulation

VEM motors of the series K21./K20. are designed for thermal class 155 [F] as standard. High-quality enamelled wires and insulating sheet materials are used in conjunction with low-solvent resin impregnation. The standard insulation system accommodates rated voltages up to 725 V [mains infeed]. It guarantees high mechanical and electrical strength, and provides for a long service life.

Motors are available in three versions:

- For converter-fed operation without filter up to 420 V converter output voltage
- For converter-fed operation without filter up to 500 V converter output voltage, curve A to DIN VDE 0530-25:2009
- For converter-fed operation without filter up to 690 V converter output voltage, curve B to DIN VDE 0530-25:2009

Rated voltage and frequency

In their basic versions, motors are supplied for the following rated voltages and frequencies:

230/400 V Δ /Y, 50 Hz	220...240 V Δ / 380...420 V Y, 50 Hz
400/690 V Δ /Y, 50 Hz	380...420 V Δ / 660...725 V Y, 50 Hz
500 V, 50 Hz	475...525 V, 50 Hz

275/480 V Δ /Y, 60 Hz	265...290 V Δ / 460...500 V Y, 60 Hz
600 V, 60 Hz	570...630 V, 60 Hz

The motors can be operated without modification of the rated output on mains systems where the voltage at rated frequency deviates by up to + 5% from the nominal value (rated voltage range A). At rated voltage, the frequency in these mains systems may deviate by $\pm 2\%$ from the nominal value. The aforementioned standard voltages to DIN IEC 60038 are taken to define the design point. Special voltages and frequencies are possible by customer request.

Motors which are to be suitable for a mains voltage to DIN IEC 60038 with an overall tolerance of $\pm 10\%$ are selected according to the corresponding rated voltage as listed in the technical tables. The rated voltage range limited by U_U and U_O is similarly specified there.

If the motors are fed with voltages between 95% and 105% of the rated voltage range (corresponding to the relevant mains voltage to DIN IEC 60038 $\pm 10\%$), then it is permissible – in accordance with EN 60034-1 – for the temperature-rise limit of the stator winding to be exceeded by approximately 10 K already at the voltage and frequency limits of the rated range, without taking into account the tolerances.

For motors of sizes 56 to 112 (DIN)/56 to 100 (progressive series), the current for the upper voltage range U_O is set such that, given normal setting of the motor circuit-breaker to $1.05 \times I_n$, the breaker will also not be tripped in no-load operation and at $\pm 5\%$ tolerance.

Fig. 15: Voltage and frequency limits for motors in accordance with EN 60034-1

- 1 Range A
- 2 Range B
- 3 Design point
- x Relative frequency f/f_N
- Y Relative voltage U/U_N

Rated output

The specified rated output applies for continuous operation to EN 60034-1 and refers to a coolant temperature of 40 °C, installation at an altitude ≤ 1,000 m above sea level, operating frequency 50 Hz and rated voltage. The series AE1R/AE2R possess thermal reserves which permit the following type-dependent continuous loads:

- Output up to 10% above rated output at coolant temperature 40 °C
 - Rated output up to coolant temperature 50 °C
 - Rated output at altitudes up to 2500 m
- The above alternative conditions are mutually exclusive. If more than one condition applies, it is necessary to reduce the output. In such cases, consultation with the manufacturer is recommended.

Motor torque

The rated torque (in Nm) delivered at the motor shaft amounts to

$$M = 9550 \cdot \frac{P}{n}$$

where P = Rated output in kW
n = Speed in rpm

In the motor selection data, the starting, pull-up and break-down torques are given as multiples of the rated torque. If the voltage deviates from its rated value, this results in an approximately quadratic change in the torque.

Ambient temperature

All VEM motors are suitable for ambient temperatures from -20 °C to +40 °C in their basic versions. Motors can be used at ambient temperatures down to -40 °C, provided they have been ordered specifically for such conditions. In case

of deviating ambient temperatures at installation sites below 1,000 m above sea level, the following factors are applied to determine the permissible output, depending on the thermal class:

Coolant temperature °C	10	15	20	25	30	35	40	45	50	55	60	70
Thermal class factor F	1.21	1.17	1.14	1.10	1.07	1.03	1.00	0.95	0.90	0.85	0.80	0.68

Table 5: Factors for adjustment of the permissible output in case of deviating coolant temperatures

If frequent moisture condensation is to be expected at the place of motor installation, we recommend the use of a space heater or other suitable precautions.

Installation altitude

Unless specified otherwise by the customer, it is assumed that the place of installation is not more than 1,000 m above sea level. If the machine is to be operated at an altitude above 1,000 m but below 4,000 m above sea level, the limit values for the temperature rise remain unchanged. The rated output, however, is subject to the following adjustment factors:

In case of installation at altitudes > 4000 m, the limit values for temperature rise must be agreed separately between the manufacturer and the customer.

Altitude above sea level in m	Coolant temperature in °C					
	< 30	30 – 40	45	50	55	60
1000	1.07	1.00	0.95	0.90	0.85	0.80
1500	1.04	0.97	0.93	0.89	0.84	0.79
2000	1.00	0.94	0.90	0.86	0.82	0.77
2500	0.96	0.90	0.86	0.83	0.78	0.74
3000	0.92	0.86	0.82	0.79	0.75	0.70
3500	0.88	0.82	0.79	0.75	0.71	0.67
4000	0.82	0.77	0.74	0.71	0.67	0.63

Table 6: Adjustment factors for altitude/coolant temperature

Overload capacity

In accordance with EN 60034-1, all motors can be subjected to the following overload conditions:

- 1.5 x rated current for a duration of 2 minutes
- 1.6 x rated torque for a duration of 15 seconds

Both conditions apply for rated voltage and rated frequency.

Rated efficiency and power factor

The efficiency η and the power factor $\cos \varphi$ are given in the lists of motor selection data.

Restarting with residual field and phase opposition

When an electric machine is switched off, a voltage system remains effective in its winding for a short time on account of the decaying magnetic field. Restarting could result in tran-

sient electrodynamic reactions in the machine. VEM motors can be restarted against a 100% residual field and phase opposition after mains failure.

Motor protection

Upon request, the following motor protection variants are possible:

- Motor protection with PTC thermistors as temperature sensors in the stator winding
- Bi-metal temperature sensor as normally closed or normally open contact in the stator winding

- KTY silicon sensors
- Resistance thermometer for winding or bearing temperature monitoring
- Bearing vibration diagnosis

Duty type

Special duty type for switched operation, short-time operation or electric braking are possible upon request. EN 60034-1 defines the following nominal duty type, which take into account thermal and mechanical conditions:

Duty type S1 – Continuous duty

Operation with a constant load which remains effective for a sufficient duration for the machine to reach thermal equilibrium. If no duty type is indicated on the name plate, the motor is designed for continuous duty S1. In the motor selection data lists, the rated data are specified for this duty type.

Duty type S2 – Short-time duty

Operation with a constant load which does not remain effective for a sufficient duration for the machine to reach thermal equilibrium, and a subsequent period of standstill with de-energised windings which is sufficient for the machine temperature to fall back to a level which deviates from the temperature of the coolant by less than 2 K. In case of duty type S2, the duration of operation must be specified.

Duty type S3 – Intermittent periodic duty

Operation which comprises a succession of identical type, each of which consists of a period of operation with constant load and a period of standstill with de-energised windings, where the starting current does not significantly influence the temperature rise. The specification of this duty type must be accompanied by indication of the cyclic duration factor. Periodic duty means that the state of thermal equilibrium is not reached during the period of the load.

Duty type S4 – Intermittent periodic duty with starting

Operation which comprises a succession of identical type, each of which consists of a distinct starting period, a period of operation with constant load and a period of standstill with de-energised windings. The specification of this duty type must be accompanied by indication of the cyclic duration factor, the mass moment of inertia of the motor and the mass moment of inertia of the load, with the latter both referring to the motor shaft. Periodic duty means that the state of thermal equilibrium is not reached during the period of the load.

Duty type S5 – Intermittent periodic duty with electric braking

Operation which comprises a succession of identical type, each of which consists of a starting period, a period of operation with constant load, a period of electric braking and a period of standstill with de-energised windings. The specification of this duty type must be accompanied by

indication of the cyclic duration factor, the mass moment of inertia of the motor and the mass moment of inertia of the load, with the latter both referring to the motor shaft. Periodic duty means that the state of thermal equilibrium is not reached during the period of the load.

Duty type S6 – Continuous operation with intermittent load

Operation which comprises a succession of identical type, each of which consists of a period of operation with constant load and a period of no-load operation. No standstill with de-energised windings occurs. The specification of this duty type must be accompanied by indication of the cyclic duration factor. Periodic duty means that the state of thermal equilibrium is not reached during the period of the load.

Duty type S7 – Continuous periodic duty with electric braking

Operation which comprises a succession of identical type, each of which consists of a starting period, a period of operation with constant load and a period of electric braking. No standstill with de-energised windings occurs. The specification of this duty type must be accompanied by indication of the mass moment of inertia of the motor and the mass moment of inertia of the load (both referring to the motor shaft).

Duty type S8 – Continuous operation with periodic changes in load and speed

Operation which comprises a succession of identical type, each of which consists of a period of operation with constant load and at a certain speed, followed by one or more periods of operation with other constant loads in accordance with different speeds. (This may be the case with pole-changing asynchronous motors, for example.) No standstill with de-energised windings occurs. The specification of this duty type must be accompanied by indication of the mass moments of inertia of the motor and load (both referring to the motor shaft), as well as the load, speed and cyclic duration factor for each relevant speed.

Duty type S9 – Continuous operation with non-periodic load and speed variation

Operation during which the load and speed generally vary non-periodically within a permissible operating range. This duty type frequently leads to overloads which far exceed the reference load. A suitable constant load corresponding to duty type S1 must be selected as the reference value for overload.

Duty type S10 – Operation with discrete constant loads

Operation characterised by no more than four discrete loads (or equivalent loads), each of which remains effective for a sufficient duration for the machine to reach thermal equilibrium. The smallest load within this duty type may be zero (no-load operation or standstill with de-energised windings). For this duty type, a suitable constant load corresponding to duty type S1 must be selected as the reference value for the individual loads.

Forced ventilation, type of cooling IC 416

Motors with forced ventilation can be used to improve the cooling effect during periods of standstill in case of switched operation (duty type S2 to S5). The use of such motors is similarly recommended to increase the available motor output in the low speed range in converter-fed operation (setting range 1:5, 1:10) or to reduce the noise level when operating motors on a converter at frequencies > 60 Hz. Depending on the required type of protection, either radial fans (protection from IP 55) or axial fans pro-

tection up to IP 55) may be used, though reductions in the type of protection may apply in individual cases. A separate rating plate with corresponding type data is attached to the forced ventilation unit. When connecting axial fan units, it is imperative to observe the direction of rotation! Forced ventilation units with electrical inputs greater than 125 W are compliant with Commission Regulation (EU) No. 327/2011 (Ecodesign requirements for fans).

Non-ventilated motors, type of cooling IC 410

These motors are designed without their own fan and without fan shroud. The motors are fully enclosed at the N-end up to shaft height 250; from shaft height 280, the sealing at the N-end is realised with grey-cast bearing covers as in the basic version. The rated output is reduced in accord-

ance with the reduced cooling, and the motor windings are adapted to this reduced output. If non-ventilated motors are installed in a cooling air flow, higher outputs may be possible upon request, depending on the cooling effect achieved.

Brake motors

VEM brake motors comprise a three-phase squirrel-cage motor and a built-on brake from the relevant manufacturer. The brakes are designed as double-face brakes and function according to the fail-safe principle. The brake system is supplied as a compact unit ready for connection and assembly, for which the most varied brake torques and versions can be realised, depending on the version ordered. The holding torque of a brake motor is always effective when the motor is in a no-voltage state. Compression springs exert a force on the axially movable armature disc and establish the brake torque by way of friction linings. The brake torque is transferred to the shaft via the keyed mounting of the lining carrier or a toothed driver hub. When a voltage is applied to the brake coil, the armature disc is pulled back and the friction linings are released to enable the motor to turn.

Note

A number of different circuit variants are possible to influence the switching time of the brake. In the basic version, the brake coil is controlled either directly with the corresponding (DC) coil voltage via a two-pole terminal in the motor terminal box, or else with an appropriate AC voltage by way of the separately supplied rectifier module. For the special version "ready for connection", the brake coil may be wired parallel to one phase of the motor winding by way of a rectifier module in the motor terminal box, depending on the frame size.

Special output assignments apply for brake motors for use in hoists and lifting gear (duty type S3), depending on the individual operating time. The relevant values can be taken from the special tables.

Paint finish

Paint finishes must withstand the most diverse stresses and influences in order to ensure long-term reliable protection. With the switch to low-solvent paint systems, VEM has adapted its production to the tightened demands of the 31st Ordinance on Implementation of the Federal Immission Control Act (Ordinance regarding the reduction of VOC emissions resulting from the use of organic solvents in specific installations – German Solvent Ordinance) [31. BImSchV] and is thus making an active contribution to the improvement of environmental protection.

Normal paint finish

Suitable for climate group “moderate” in accordance with IEC 60721-2-1: Indoor and outdoor installation, moderate climate (short-time exposure to relative humidity up to 100% at temperatures up to +30 °C; continuous exposure to relative humidity up to 85% at up to +25 °C)

Special paint finish

Suitable for climate group “worldwide” in accordance with IEC 60721-2-1: Outdoor installation in atmospheres with a general tendency to increased stress, tropical climate (short-time exposure to relative humidity up to 100% at temperatures up to +35 °C; continuous exposure to relative humidity up to 98% at up to +30 °C)

Special colour*: Paint finish 01 not available in RAL 1000 to 2011, RAL 7047, 9001, 9002, 9005, 9010, 9011, 9016, 9017 and light ivory textured paint 1015, KK

Fig. 16: Paint finishes after switch to water-soluble paint systems

If no colour is specified, all motors are supplied in **RAL 7031 “Blue grey”**. If a different colour is required, the corresponding RAL number and colour designation must be specified at the time of ordering. VEM paint systems provide lasting, high-

performance corrosion protection. Their functional capabilities have been proven in exacting and comprehensive test series. Customer-specific paint systems are always subject to prior consultation.

Modular construction of different series and modifications

The design concepts of the different series provide for the optional incorporation of components such as pulse generators, tacho generators, brakes, speed monitors or forced ventilation units to solve the customer's individual control tasks.

Standard version
Type of cooling IC 411, self-ventilated

Special version
Type of cooling IC 416, forced ventilation

Special version
Type of cooling IC 410, non-ventilated

Special version
Type of cooling IC 411, self-ventilated with built-on incremental encoder

Special version
Type of cooling IC 416, forced ventilation with built-on incremental encoder

Special version
Type of cooling IC 410, non-ventilated with built-on incremental encoder

Special version
Type of cooling IC 411, self-ventilated with built-on brake

Special version
Type of cooling IC 416, forced ventilation with built-on brake

Special version
Type of cooling IC 410, non-ventilated with built-on brake

Special version
Type of cooling IC 411, self-ventilated with built-on brake and incremental encoder

Special version
Type of cooling IC 416, forced ventilation with built-on brake and incremental encoder

Special version
Type of cooling IC 410, non-ventilated with built-on brake and incremental encoder

1

Maintenance

Attention is drawn expressly to the safety notes and instructions, and here in particular to the procedures for safe isolation, safeguarding against accidental restarting, and checking the proper disconnection of all components connected to a voltage source. When a motor is disconnected from the mains supply for maintenance purposes, particular care must be taken to ensure that any auxiliary circuits, e.g. space heaters, forced ventilation fans or brakes, are similarly disconnected from their power supply. If it is necessary to dismantle the motor to perform maintenance work, the sealing compound left on the centring edges must be removed. New sealing compound

of a suitable type is to be used for sealing when the motor is reassembled. Any copper sealing rings must always be refitted.

Careful and regular maintenance and inspection is imperative, so as to be able to detect and rectify any arising problems in good time before further damage is caused. As the operating conditions are not exactly defined, it is only possible to specify general maintenance intervals, under the assumption of trouble-free operation. These intervals must always be adapted in accordance with the local circumstances (contamination, loads, etc.).

What is to be done?	Regular interval	Max. interval
Initial inspection	After approx. 500 operating hours	At the latest after six months
Check of air passages and motor surface	Depending on degree of local contamination	
Relubrication (option)	See name plate or lubrication plate	
Main inspection	Approx. 10,000 operating hours	Once a year
Drain condensation	Depending on climatic conditions	

Inspections

Initial inspection

In accordance with the specifications, an initial inspection of the motor should be performed after approx. 500 operating hours, but at the latest after six months.

The following checks are to be performed with the motor at standstill:

- a) Check the foundation. There must be no cracks or other damage such as depressions or the like.

The following checks are to be performed with the motor running:

- a) Check the electrical parameters.
- b) Check the bearing temperatures. It is to be determined whether the permissible bearing temperatures are exceeded during operation of the motor.
- c) Check for unusual noises during operation. An acoustic check is performed to determine whether the quiet running of the motor has deteriorated.

If the checks reveal any deviations from the values specified in the operating and maintenance manual, or any other defects or errors, these deviations and defects must be rectified immediately.

Main inspection

In accordance with the specifications, a main inspection should be performed once a year or after approx. 10,000 operating hours.

The following checks are to be performed with the motor at standstill:

- a) Check the foundation. There must be no cracks or other damage such as depressions or the like.
- b) Check the alignment of the motor. The alignment must lie within the specified tolerances.
- c) Check the mounting screws and bolts. All screws and bolts which are used to make mechanical and electrical

joints and connections must be properly tight (see also the table of tightening torques for screws and bolts under Section 11 "Commissioning" of the operating and maintenance manual).

- d) Check the cables and the insulation materials. It is to be checked whether the cables and the insulation materials used are in a good and proper condition. They must not display discolouration, and in particular not burn marks, and must not be broken, cracked or otherwise damaged.
- e) Check the insulation resistance. When checking the insulation resistance of the winding, observe the specifications given in the operating and maintenance manual (Section 9).
- f) Depending on the grease quality and the bearings of the motor, it may also be necessary to replace the grease of the anti-friction bearings after 10,000 operating hours (see also Section 13 "Bearings and lubrication" of the operating and maintenance manual). Otherwise, the specified relubrication intervals for the anti-friction bearings must be observed separately, as they deviate from the inspection intervals.

The following checks are to be performed with the motor running:

- a) Check the electrical parameters.
- b) Check the bearing temperatures. It is to be determined whether the permissible bearing temperatures are exceeded during operation of the motor.
- c) Check for unusual noises during operation. An acoustic check is performed to determine whether the quiet running of the motor has deteriorated.

If the checks reveal any deviations from the values specified in the operating and maintenance manual, or any other defects or errors, these deviations and defects must be rectified immediately.

Long-term storage (over 12 months)

If long-term storage is necessary, motors must be protected from vibration and kept in closed, dry rooms at temperatures between -20 and +40 °C and in an atmosphere free from aggressive gases, vapours, dusts and salts. Motors should preferably be transported and stored in their original packaging. Storage and transport resting on the fan shrouds is not permissible. Unprotected metal surfaces, for example shaft ends and flanges, are to be provided with long-term corrosion protection, in addition to the temporary corrosion protection applied before motors leave the factory.

If the motors are subject to condensation under the given ambient conditions, precautions are to be taken to protect the motors against moisture. In such cases, the motors

must be specially packed in air-tight welded foil or under plastic foil with appropriate desiccants. Desiccant sachets are also to be placed in the motor terminal boxes.

For transport, the ring bolts/load beams of the motors are to be used together with appropriate lifting tackle. The ring bolts/load beams are only intended for lifting of the bare motor without additional built-on parts such as base plate, gearing, etc.

Motors with reinforced bearings are supplied with a transport brace. The transport brace on the shaft end should only be removed after assembly of the motor and prior to the first starting.

Disposal

The applicable national regulations are to be observed with regard to disposal of the machines.

It is furthermore to be ensured that oils and greases are collected for disposal in accordance with the corresponding regulations on waste oils. They must not be contaminated with solvents, cold cleaners and paint residues.

The individual materials should be segregated for recycling. The most important components are grey cast iron (housing), steel (shaft, stator and rotor lamination, small parts), aluminium (rotor), copper (windings) and plastics (insulation materials, such as polyamide, polypropylene, etc.). Electronic components such as circuit boards (converter, sensors, etc.) are recycled separately.

Warranty, repairs, spare parts

Our authorised service workshops are responsible for all warranty repairs, unless expressly agreed otherwise. They can also be contacted in connection with any other repairs which may become necessary. Information on our customer service network can be requested from our central

offices. Maintenance in accordance with the instructions given in the section "Maintenance" is not considered a breach of the warranty stipulations. It thus cannot be deemed to release the manufacturer from any agreed warranty obligations.

Limit speeds

If motors are operated at above the rated speed, the limit values of the anti-friction bearings, the strength of the rotating parts, critical rotor speeds and the circumferential speed of the fans must be observed.

The limit speeds specified in the table below may already require precautionary measures such as special fans, special bearings or special balancing.

Type	Synchronous speed at 50 Hz		
	1500 rpm	1000 rpm	750 rpm
ARC 112	3600	2400	1800
ARC 132	3600	2400	1800

ARB 54, 65	3000	2000	1500

Tolerances Electrical parameters

According to DIN EN 60034-1, the following tolerances are permissible:

Efficiency (when determined indirectly)	-0.15 (1- η) at $P_N \leq 150$ kW -0.1 (1- η) at $P_N > 150$ kW
Power factor	$\frac{1-\cos\varphi}{6}$ min. 0.02 max. 0.07
Slip (with nominal load and at operating temperature)	± 20 % at $P_N \geq 1$ kW ± 30 % at $P_N < 1$ kW
Starting current (with intended starting circuit)	+20 % no lower limit
Starting torque	- 15 % and + 25 %
Pull-up torque	- 15 %
Breakdown torque	- 10 % (M_K/M_N still at least 1.6 after application of this tolerance)
Moment of inertia	± 10 %
Noise level (sound pressure level at measuring surface)	+3 dB (A)

These tolerances are applicable to the guaranteed values for three-phase asynchronous motors, taking into account necessary manufacturing tolerances and possible deviations in the raw materials used. The standard includes the following notes:

1. It is not intended that guarantees necessarily have to be given for all or any of the items involved. Quotations including guaranteed values subject to tolerances should

say so, and the tolerances should be in accordance with the table.

2. Attention is drawn to the different interpretation of the term "guarantee". In some countries, a distinction is made between guaranteed values and typical or declared values.
3. Where a tolerance is stated in only one direction, the value is not limited in the other direction.

Mechanical parameters – Usual tolerances

Dimension symbol to DIN EN 50347	Meaning of dimension	Fit or tolerance
B [a]	Spacing of fixing holes for housing feet in axial direction	± 1 mm
P [a]	Diameter or width across corners of flange	- 1 mm
A [b]	Spacing of fixing holes for housing feet transverse to axial direction	± 1 mm
N [b]	Diameter of centring edge of mounting flange	up to diameter 230 mm j6 from diameter 250 mm h6
D, DA [d, d ₁]	Diameter of cylindrical shaft end	up to diameter 48 mm k6 from diameter 55 mm m6
M [e]	Pitch circle diameter of mounting flange	± 0.8 mm
AB [f], AC [g]	Greatest width of motor (without terminal box)	+ 2 %
H [h]	Shaft height (bottom edge of foot to centre of shaft end)	up to 25 - 0.5 mm over 250 - 1 mm
L, LC [k, k ₁]	Total motor length	+ 1 %
HD [p]	Total motor height (bottom edge of foot, housing or flange to highest point of motor)	+ 2 %
K, K' [s, s ₁]	Diameter of mounting holes of foot or flange	+ 3 %
GA, GC [t, t ₁]	Bottom edge shaft end to top edge key	+ 0.2 mm
F, FA [u, u ₁]	Width of key	h9
C, CA [w ₁ , w ₂]	Distance from centre of first foot mounting hole to shaft shoulder or flange face	± 3.0 mm
	Distance from shaft shoulder to flange face with fixed bearing at D-end	± 0.5 mm
	Distance from shaft shoulder to flange face	± 3.0 mm
m	Motor mass	- 5 bis + 10 %

Usual fits for shaft ends

Shaft ends	up to $\varnothing 48$	k6
	from $\varnothing 55$	m6
Mating part		H7

Types of construction

The most common types of construction are shown in the table below. Further types of construction can be supplied upon request. The type of construction is indicated on the name plate in accordance with Code I, EN 60034-7. Standard motors which are ordered in a basic type in sizes 56 to 200 can also be operated with the following derived types of construction.

- IM B3 in IM B5, IM B7, IM B8 and IM V6
- IM B35 in IM 2051, IM 2061, IM 2071 and IM V36
- IM B34 in IM 2151, IM 2161, IM 2171 and IM 2131
- IM B5 in IM V3
- IM B14 in IM V19

Motors of types IM V5, IM V1 or IM V18 can be designed with an optional protective canopy to prevent small parts falling into the motor. With types of construction with the shaft end pointing upwards, it is the responsibility of the user to provide a suitable cover to prevent small parts falling into the fan shroud (see also standard IEC/EN 60079-0). The cooling air flow must not be hindered by the cover. From size 225, it is necessary to consult the manufacturer regarding types of construction IM V5, IM V6, IM B6, IM B7 and IM B8. The types of construction IM B5 and IM V3 are not available for frame sizes from 315 L. To facilitate connection to the mains power supply, the terminal box can be rotated by 90° with all types of construction.

Basic type of construction	Derived types of construction					
IM B3 IM 1001 	IM V5 IM 1011 	IM V6 IM 1031 	IM B6 IM 1051 	IM B7 IM 1061 	IM B8 IM 1071 	
IM B35 IM 2001 	IM V15 IM 2011 	IM V36 IM 2031 	IM 2051 	IM 2061 	IM 2071

Heavy-duty roller table motors

Series ARB for mains operation
Series ARC for converter-fed operation

Heavy-duty roller table motors

Series ARB for mains operation
Series ARC for converter-fed operation

The most important technical data are summarised in the following table. Further information can be taken from the catalogue section "Technical explanations".

Product group	Roller table motors, squirrel-cage rotor, IEC/DIN
Series	ARB... version for mains operation ARC... version for converter-fed operation, IEC 60034-17, converter output voltage up to 420 V Curve A, IEC TS 60034-25, converter output voltage > 420 up to 500 V Curve B, IEC TS 60034-25, converter output voltage > 500 up to 690 V
Rated output	ARB... 0.4 kW to 5.5 kW ARC... 0.4 kW to 290 kW
Sizes	ARB... 22 (132), 33 (125), 54 (170) and 65 (200) ARC... 112 to 400
Housing material	Grey cast iron
Rated torque	ARB... 8 to 77 Nm ARC... 8 to 2560 Nm
Method of connection	Single-speed motors are designed in star-delta configuration as standard.
Stator winding insulation	Thermal class 155, optional 155 [F(B)], 180 to EN 60034-1 (IEC 60034-1)
Type of protection	IP 55 acc. to EN 60034-5 (IEC 60034-5) optionally IP 56 and higher
Type of cooling	IC 410 [non-ventilated] acc. to EN 60034-6 (IEC 60034-6)
Coolant temperature/ installation altitude	Standard -20 °C to +40 °C, Altitude 1,000 m above sea level
Rated voltage	Rated voltage range A to EN 60034-1 (IEC 60034-1) Standard voltages to EN 60038 50 Hz, 230 V, 400 V, 500 V, and 690 V 60 Hz, 275 V, 480 V and 600 V
Types of construction	IM B3, IM B35, IM B5 and derived types complying with DIN EN 60034-7
Paint finish	Normal finish "Moderate", colour RAL 7031, blue-grey Special finish "Worldwide", colour RAL 7031, blue-grey
Vibration severity grade	Grade "A" as standard for machines with no special vibration requirements
Shaft ends	acc. to DIN 748 (IEC 60072), balanced with half-key
Sound pressure level	acc. to DIN EN ISO 1680, tolerance +3 dB, see technical explanations for values
Limit speeds	See section "Limit speeds" in the chapter "Technical explanations"
Bearing design	See section "Bearings" in the chapter "Technical explanations"
Motor mass	See technical selection lists
Terminal box	See section "Terminal boxes" in the chapter "Technical explanations"
Documentation	An operating and maintenance manual, a terminal plan and a safety data sheet are supplied with each motor.
Tolerances	See section "Tolerances" in the chapter "Technical explanations"
Options	See "Overview of modifications" of the basic catalogue 01-2012 in the chapter "Technical explanations"

t_k... max. permissible blocking period

B...Acceleration factor

B = J_G × z × k [kgm²/h]

J_G... Total moment of inertia in kgm² for motor + roller + load, referred to the motor shaft

z... Switching frequency in starts per hour

k... Factor to account for switched operation, k = 1 for simple starting, k = 4 for reversing

Three-phase roller table motors with squirrel-cage rotor for converter-fed operation, series ARC

Non-ventilated with surface cooling, IC 410

Planning data for switched operation calculations/motor pre-selection

Duty type S9, thermal class F, type of protection IP 55, rated frequency 50 Hz

Insulation system for \dot{U} max. 1.35 kV; du/dt max. 1.5 kV/ μ s

ARC	Equivalent S1 output						Transient peak load (max. 10 s)					No-load

Welded steel three-phase asynchronous motors

Transnorm motors
Series DS, DSf, DSo, DSWM
for mains and converter-fed operation

Welded steel three-phase asynchronous motors for rolling mills

Transnorm motors, series DS, DSf, DSo, DSWM for mains and converter-fed operation

The most important technical data are summarised in the following table.
Further information can be taken from the catalogue section "Technical explanations".

Product group	Roller table motors, squirrel-cage rotor, IEC
Series	DS..
Rated output	100 kW to 1500 kW
Sizes	355 to 630
Housing material	Sheet steel, with welded radial ribs or double jacket for type of cooling IC 31, IC 71
Rated torque	1000 Nm to 15000 Nm
Method of connection	Single-speed motors are designed in star-delta configuration as standard
Stator winding insulation	Thermal class 155, optional 155 [F(B)], 180 to EN 60034-1 (IEC 60034-1)
Type of protection	IP 55 acc. to DIN EN 60034-5 (IEC 60034-5), optionally IP 56 and higher
Type of cooling	IC 411 [self-ventilated], IC 416 [forced ventilation], IC 410 [non-ventilated] or IC 31 [water-jacket cooling] acc. to EN 60034-6 (IEC 60034-6)
Coolant temperature/ installation altitude	Standard -20 °C to +40 °C, Altitude 1000 m above sea level
Rated voltage	Rated voltage ranges A and B acc. to DIN EN 60034-1 (IEC 60034-1), Standard voltages to EN 60038 50 Hz, 230 V, 400 V, 500 V, and 690 V 60 Hz, 275 V, 480 V and 600 V
Types of construction	IM B3, IM B35, IM B5 and derived types complying with EN 60034-7
Paint finish	Normal finish "Moderate", colour RAL 7031, blue-grey Special finish "Worldwide", colour RAL 7031, blue-grey
Vibration severity grade	Grade "A" as standard for machines with no special vibration requirements
Shaft ends	acc. to DIN 748 (IEC 60072), balanced with half-key
Sound pressure level	acc. to DIN EN ISO 1680, tolerance +3 dB, see technical explanations for values
Limit speeds	Details upon request
Bearing design	Details upon request
Motor mass	See technical selection lists.
Terminal box	Details upon request
Documentation	An operating and maintenance manual, a terminal plan and a safety data sheet are supplied with each motor.
Tolerances	See section "Tolerances" in the chapter "Technical explanations"
Options	See "Overview of modifications" of the basic catalogue 01-2012 in the chapter "Technical explanations"

Welded steel three-phase asynchronous motors for rolling mills

Overview of sizes and outputs

Types of cooling IC 411 [self-ventilated], IC 416 [forced ventilation], IC 410 [non-ventilated] and IC 31 [water-jacket cooling]

Duty type S1, thermal class 155 [F], type of protection IP 55, rated voltage 690 V, rated frequency 50 Hz

Type of cooling	IC 411		IC 416		IC 410		IC 31

Light-duty roller table motors

Three-phase roller table motors with squirrel-cage rotor
Series IE2-AE1R
for mains and converter-fed operation

Light-duty roller table motors

**Three-phase roller table motors with squirrel-cage rotor
Series IE2-AE1R for mains and converter-fed operation**

The most important technical data are summarised in the following table.
Further information can be taken from the catalogue section "Technical explanations".

Product group	Squirrel-cage rotor, IEC/DIN
Rated output	0.09 kW to 500 kW IE2 version for output range 0.75 kW to 375 kW, 2, 4 and 6 poles
Sizes	56 to 355
Housing material	Grey cast iron
Rated torque	0.3 Nm to 3600 Nm
Efficiency determination	EN 60034-2-1, ≤ 1 kW direct measurement, > 1 kW residual loss method
Method of connection	Single-speed motors are designed in star-delta configuration as standard.
Stator winding insulation	Thermal class 155, optional 155 [F(B)], 180 to EN 60034-1 (IEC 60034-1)
Type of protection	IP 55 acc. to EN 60034-5 (IEC 60034-5)
Type of cooling	IC 411 acc. to EN 60034-6 (IEC 60034-6)
Coolant temperature/ installation altitude	Standard -20 °C to +40 °C, Altitude 1000 m above sea level
Rated voltage	Standard voltages acc. to EN 60038 50 Hz, 400 V 60 Hz, 460 V
Types of construction	IM B3, IM B35, IM B5 and derived types complying with DIN EN 60034-7
Paint finish	Normal finish "Moderate", colour RAL 7031, blue-grey Special finish "Worldwide", colour RAL 7031, blue-grey
Vibration severity grade	Grade "A" as standard for machines with no special vibration requirements
Shaft ends	acc. to DIN 748 (IEC 60072), balanced with half-key
Limit speeds	See tables of limit speeds
Bearing design	See tables of bearing design data
Motor mass	See technical selection lists
Terminal box	See section "Terminal boxes" in the chapter "Technical explanations" of the basic catalogue for low-voltage asynchronous motors/IEC squirrel-cage motors
Documentation	An operating and maintenance manual, a terminal plan and a safety data sheet are supplied with each motor.
Tolerances	See section "Tolerances" in the chapter "Technical explanations"
Options	See "Overview of modifications" in the basic catalogue for low-voltage asynchronous motors/IEC squirrel-cage motors

Three-phase roller table motors with squirrel-cage rotor Efficiency class “High Efficiency” acc. to EN 60034-30

with surface cooling, duty type S1, continuous duty, thermal class 155, type of protection IP 55
Efficiency determined to EN 60034-2-1:2007: ≤ 1 kW direct measurement, > 1 kW residual loss method

Three-phase roller table motors with squirrel-cage rotor Efficiency class “High Efficiency” acc. to EN 60034-30

with surface cooling, duty type S1, continuous duty, thermal class 155, type of protection IP 55
Efficiency determined to EN 60034-2-1:2007: ≤ 1 kW direct measurement, > 1 kW residual loss method

Motor selection data										Design point 400 V, 50 Hz/460 V, 60 Hz

Dimensions

Flange dimensions
Heavy-duty roller table motors
Welded steel three-phase asynchronous motors
Light-duty roller table motors

Notes concerning dimensions

Dimension designations in accordance with EN 50347 and IEC 60072

Flange sizes in the dimension tables are specified in accordance with DIN 42948.

VEM motors GmbH reserves the right to modify technical data without prior notice. The dimensions shown in catalogues may not be up to date. Binding dimensional data can be requested from the VEM sales organisation.

All dimensions in mm

According to DIN EN 50347, the different sizes of FF flanges possess through-holes, while FT flanges possess threaded holes. The flange designations A and C defined in DIN 42948 remain valid.

Flange assignments which deviate from the standard are specified in the flange assignment tables.

For tolerances for the dimension N (b_1), refer to the corresponding dimension tables LA (c_1) depth of engagement

Three-phase roller table motors with squirrel-cage rotor

^{*)} Centre holes to DIN 332-DS

^(*) Terminal box left/right

Three-phase roller table motors with squirrel-cage rotor Efficiency class "High Efficiency" acc. to EN 60034-30

Sizes 56 to 280,
with surface cooling, type of cooling IC 411, type of protection IP 55

Type of construction IM B35 [IM 2001]

Flange dimensions, see page 56

¹⁾ Centre holes to DIN 332-DS

²⁾ Terminal box left/right

Three-phase roller table motors with squirrel-cage rotor Efficiency class “High Efficiency” acc. to EN 60034-30

Sizes 56 to 180,
with surface cooling, type of cooling IC 411, type of protection IP 55

Type of construction IM B34 [IM 2101]

Flange dimensions, see page 56

^{*)} Centre holes to DIN 332-D5

^{**)} Terminal box left/right

Three-phase roller table motors with squirrel-cage rotor Efficiency class “High Efficiency” acc. to EN 60034-30

Sizes 315
with surface cooling, type of cooling IC 411, type of protection IP 55

Type of construction IM B5 [IM 3001] up to size 315 MY, Type of construction IM V1 [IM 3011]

Flange dimensions, see page 56
